

Rice

Optimaze nutrition to improve the production

B-POWER is a bioactivator made with Boron and humic and fulvic acids. This way, the boron is easily absorbed by the plant and diffused evenly.

B-POWER guarantees a perfect quantity of boron to the plant **to improve the fertility of the rice spikes and to reduce cold-related stress** (sterility due to cold comebacks).

B-POWER, furthermore, stimulate the absorption of nutritive elements and improves the plant radical activity.

LEAF N-FAST grants nutrition to the flag-like leaf, this way it simplifies the rapid transformation of nitrogen in protein. The complexed magnesium stimulates and **improves the photosynthetic process, keeping the plant green**.

LEAF N-FAST thanks to the adhesive and humifying action of lignosulfates, **improves absorption of the products with the same principles**.

**Grow well,
to eat better**

Technical line:

in water/ dry seeding

Pre-seeding:

- Soils with a low organic substance
Master Plus 10-8-15 - 300-400 kg/ha
- Soils with a rich presence of organic substance
Land 30 10-6-15 - 300-400 kg/ha

During the growth (on dry soil before submersion and after diserbation):

- Rice with the risk of lodging
Ortofrutto Special Top - 150-200 kg/ha
- Rice in soils with low concentration of nitrogen
Cerea Slow 46 + NBPT - 150-200 kg/ha

First fungicide intervention (growth beginning):

B-Power - 2,5-3 l/ha

Second fungicide intervention (flag-like leaf):

Leaf N-Fast - 3-5 l/ha
